

Some GOOGLE CHROME tips

1. Found an image, online, that you like to locate more (similar) images of?
 - a. Right-click the image and choose SEARCH GOOGLE FOR IMAGE. Google will present you with similar images that it found. Cool.
2. Browsing the web and need to make some quick notes? These two browsers come with a built-in note pad:
 - a. Just paste `data:text/html,%20<html%20contenteditable>` into the Address Bar and press [ENTER].
 - b. A new, blank browser page will appear – go ahead...click and start typing.
 - c. When done, you can either copy and paste it to another program or save it ([CTRL]S) although you can only save it as a webpage.
3. Make switching between multiple webpages easier. I'm not a mouse person – so when I need to pivot back and forth between two (tabbed) webpages, I hate having to grab my mouse and click on the other tab. Then grab it again and click on the original tab when done. It irks me.

So...just press [CTRL] *number* (where *number* is the position of the tab that you want to switch to. In this example, I'd press [CTRL] 1 to switch to the ONTARIO tab, [CTRL] 2 to switch to the CUBA tab, and [CTRL]3 to switch back to the CTC COMPUTE TRAINING tab.

4. QUICKER SEARCHES. Let's say you've landed on a page and find a word, on that page, that you'd like to do a further search on:
 - a. Select the word or phrase.
 - b. RIGHT-CLICK the word or phrase and choose SEARCH GOOGLE FOR xxx.
5. OPEN ACCIDENTALLY CLOSED TABS. We've all done it – closed a tab then immediately thought "No!"
 - a. Just press [CTRL][SHFT] T to get it back. YAY! (In fact, if you keep pressing [CTRL][SHFT] T, Google Chrome will keep re-opening more and more recently-closed tabs.
